COMPLETE LISTING OF THE CLAIMS

The following lists all of the claims that are or were in the above-identified patent application.

1. (Canceled)

2. (Previously Presented) The multiplier of claim 3, wherein:

each multiplier is capable over multiplying an 8-bit value by an 8-bit value to generate a 16-bit result;

the first multiplier has an output port including 16 least significant bits coupled to 16 least significant bits of a first input port of the adder;

the second multiplier has an output port including 16 least significant bits coupled to bits eight through twenty-three of a second input port of the adder;

the third multiplier has an output port including 16 least significant bits coupled to bits eight through twenty-three of a third input port of the adder; and

the fourth multiplier has an output port including 16 least significant bits coupled to seventeen through thirty-two of a fourth input port of the adder.

3. (Previously Presented) A multiply unit comprising:

a first multiplier, a second multiplier, a third multiplier, and a fourth multiplier;

an adder having input ports which are larger than output ports of the multipliers, wherein an output port of the first multiplier is coupled to least significant bits of an input port of the adder, output ports of the second and third multipliers are coupled to input ports of the adder but not least or most significant bits of the input ports, and an output port of the fourth multiplier is coupled to an input port of the adder but not the least significant bits of the input port;

an output circuit that provides output signals from the multipliers when the multiplier circuit operates in a first mode, and provides an output signal from the adder when the multiply unit operates in a second mode; and

an operand selection circuit coupled to the first, second, third, and fourth multipliers, wherein:

in the first mode, the operand selection circuit applies a first portion of a first operand

signal and a first portion of a second operand signal to the first multiplier, applies a second portion of the first operand signal and a second portion of the second operand signal to the second multiplier, applies a third portion of the first operand signal and a third portion of the second operand signal to the third multiplier, and applies a fourth portion of the first operand signal and a fourth portion of the second operand signal to the fourth multiplier; and

in the second mode, the operand selection circuit applies the first portion of the first operand signal and the first portion of a second operand signal to the first multiplier, applies the second portion of the first operand signal and the first portion of the second operand signal to the second multiplier, applies the second portion of the first operand signal and the first portion of the second operand signal to the third multiplier, and applies the second portion of the first operand signal and the second portion of the second operand signal to the fourth multiplier.

5. (Canceled)

6. (Canceled)

7. (Canceled)

8. (Canceled)

9. (Canceled)

10. (Canceled)

11. (Previously Presented) The method of claim 12, wherein the output product values when the multiply unit operates in the first mode have a first data width that is one fourth of a data width that the single output product value has when the multiply unit operates in the second mode.

12. (Previously Presented) A method for operating a multiply unit containing a plurality of multipliers, comprising:

operating the multipliers separately to generate a plurality of output product values when the multiply unit operates in a first mode; and

combining product values from the multipliers to generate only a single output product value when the multiply unit operates in a second mode, wherein:

in the first mode, the method further comprises: separating input data on a first input

bus into a first, second, third, and fourth multiplicands; separating input data on a second input bus into fifth, sixth, seventh, and eighth multiplicands, and having first, second, third, and fourth of the multipliers respectively multiply the first and fifth multiplicands, the second and sixth multiplicands, the third and seventh multiplicands, the fourth and eight multiplicands; and

in the second mode, the method further comprises: separating input data on the first input bus into first and second multiplicands; separating input data on the second input bus into fifth and sixth multiplicands, and having first, second, third, and fourth of the multipliers respectively multiply the first and fifth multiplicands, the first and sixth multiplicands, the second and fifth multiplicands, the second and sixth multiplicands.
